

they slept trough to early afternoon
it was no big surprise seeing nila and luoma having successfully integrated the features of perma and ascendes new skin
they were chasing each other trough the appartement playing with their new chamaeleon style blending in features
mundu did not change as he for one did not bath with the petri dish cell samples and second did not yet want to change
he wanted to have his very own gentle meeting with wild plants and animals
when he told ascende who was laying himself onto the balcony to breakfast some afternoon sunrays
about his plan to move to hawaii and setup a similar hut like perma had in the canaries
(here the author would like to confess a possible incongruency in the story... are there chamaeleons on the canaries ... perhaps not native... but eventually some people brought them in from the tropics to set them free here ...)

ascende was very interested in this approach, he saw the benefits for the research project

when more and more individualists like mundu went to new wild places to receive all kinds of new samples, possibly find new ways of merging human and animal and plant cells, ways probably not yet known to science... that would make a wide base on what others here in the parisian appartement could build up on
perma was now also photosynthetically enabled, as she too bathed last night with ascende/plant cell cultures

so the four of them only ate minute amounts of the aeroponically grown fruit in the appartement leaving it all to mundu who was now the only one of the five unchanged

the three girls joined into the conversation

when ascende was talking to mundu how they would finance the continuous setup of outposts in wild spaces everywhere on the planet

ascende... there is still around a half a million left of the money an art conaisseur donated me 3 years ago

i could set for example 200 thousands to this purpose

perma... we could buy in one act some good sized areas of the amazon, the congo and the sumatran rain forests ... beside a small patch of wild space in hawaii for you mundu... and the ownership of the rain forest spaces we would share with the native tribes there

nila... if they agree with our goal to create millions of more than human like androids ...

luoma... if we explain them that we not plan to exploit the androids for unsustainable purposes but we would like them to be sovereign beings what we do ask the favour to help us in the transition time

mundu... the transition from the everyone fights for survival in an scarcity dominated economy to a hopefully soon arriving future setting where sharing and wise recycling of the already mined ores and new nanotech materials will bring abundance to all

...ascende... i have heard the argument that the native people in the rainforests do stand in the way of economical progress when resisting roadway and waterdam construction

of course it is for the best of the planet if they resist the destruction of the few left

primary forests... but with our research... where we are very thankfully looking to meet wild animals and plants in most pristine areas as possible building dna for the androids... there might be an immense economical value

nila... i am seeing before my inner eye how a parrot in the amazon shares its dna with one of us... how precious would a feather clothed flying android be...

in hard money translation

...luoma... you are right, these are very good arguments

we have just discussed this morning the three of us whom we could invite to come here to spend some transformning times

perhaps we could ask our friends in sao paulo if they wanted to go to the amazon to propose this joint venture

securing the land rights for the native tribes while granting us the right to be guests in their territory

to gently collect dna samples for our android project

nila... i know already 5 who were very interested when we told them we are leaving to paris for cell evolution research

mundu... and i have made some good contacts with some progressive thinkers in the congo bassin

they are very concerned to find possiblities to help saving the last areas of primal forests

...perma... with a traveller who came once to my permahut i spoke about a tribe in sumatra what would be happy for help in securing their habitat

...ascende... let us go there first before we go to the canaries...

nila,you take 60 thousands to go to the amazon

mundu travels to africa with 60 thousand to secure some congo rainforests before doing the research in hawaii and perma and me take another 60k to sumatra

leaves 20 thousands for the traveling costs

mundu... and the hawaian place we probably could crowdfund... would give again others the possibility to join in... like ... if we need 50 000 to buy the place in hawai, everyone giving 5000 would be a co-owner

ascende... with me giving the first 25 000 for the five of us being already half of the owners

mundu... but will you have enough reserves left to fund all the necessary contributions to the host cities of sao paulo, paris...

ascende... i have set aside for that 300 000 already...

when the rainforests parts are secured and you have the hawaiian place half way funded, i will have still a hundred thousand left what i will keep for travelling

....perma... but eventually we will be able to learn cellularily from the parrots ...

sample cell cultures from the amazon... and in my place in the canaries i might be able to be blessed with some spit from my dolphin friends...

...luoma... so you hint at a stage of our cell evolution growth where we can shift from feathery winged to smooth swimming fin enhanced bodies at will...

...mundu...if the cell samples are being given to us with no or allmost none violence involved

ascende... i wonder if we should keep sending some samples to paris as to have a central lab where the ones who would quickly become multicellularly enhanced...

perma... yes, it will help take the load of the wild places and will speed up the funding of the android research, like we said we would need 5 millions to be ready to make a prototype

...ascende... you are right, if someone who is kind of rich with 20 millions made with an internet software sell comes visiting our parisian lab and bathes in some tiny bits of 20 or so different human/animal/plant petri dish cultivated cell samples we have helped to grow with our own cells and the ones being given to us in pleasure... the rich guy might decide 3 millions to donate to the project... luoma... i know some professional theatre travellers in many cities who would give half of their property for the ability to shapeshift their skin from wings to fins

and it was this way it went

all five of them left with some money in the pockets and petri dishes cameras and satellite internet phones to their destinations

only luoma stayed in paris to keep up the conversation with the hundreds of new people who were now following the live streams out of the parisian appartement when nila left to sao paulo, mundu for the congo, perma and ascende towards sumatra the next morning, there were already 6 people signed up for wanting to visit luoma in her bath... partly they were sex addicts enticed by what they have seen in the last two days via the 24 hours livestreams

infrared in the night... but to same parts as they were sexually hungry they too were longing to find reconnection to their cellular completion

perma and ascende... feeling a bit parently for mundu nila and luoma... had long talks with all of the six applicants and found them to be worthy of joyning ...

luoma... and do not worry, if i see one who wants to exploit my fun for sex or is not gently enough in the bath when growing multicellular... i will ask the men or woman out ... by softly explaining to him that the gentleness in our research is of the highest importance

...nilq... like last night when we pissed on each other and drunk each others urine, this was with full of admiration and appreciation for each others high degree of healtyness, i would never allow a sick person to pee on me in a dominating negative emotion... so would you never, luoma...

with her saying, yes my fruity sister, we know what is healthy and what not

ascende... oh perhaps you forgot... the sexual intercourse and or uptake of others peoples urine is not a requirement for the skin cell merging

...perma... ascende and me have both bathed alone with the cell samples what we have cultivated the days before...

mundu... exactly how i want to do it in hawaii or at least similar...

nila... so you think the quality of our skin cells having merged with ascende and perma s experimental skins is lower than the one you will have when your own skin cells will merge with animal plant informations...

mundu... i really do not know... but i would advise you two luoma and nila to get out somewhere in the wild too to get your direct wildness upgrade...

perma... good subject, although i do not see it as a problem when one human being donates his /her cell cultivations to an other human being, this are two approaches what can well be combined

...ascende... with the great question here... can someone who has merged with an other persons already evolved cells ... find a next merge with animal plant

directly ... luoma... i actually do not see a reason against it, look, when i heard you speaking about how you bathed in your cell cultivations there was this urge in me to devour your semen right while you was talking about the merge... this semen given i that moment was probably helping my organism in the bath with your petri

dish cell samples to accept them, samewise with permas ejaculations i licked up in our little orgy we enjoyed last night, please understand me right, i do not plan to entertain sex driven ones ... but if they are gently and well behaved i might teach them to use their sexual drive for their and our goal of personal spritual as well as body material growth

...ascende... we believe you will well master the task to spend time with healty minded individuals while we are travelling...

perma... when you luoma just now talked about the urine exchange happining in a appreciative way i had to think about a documentary i saw on tv recently where a reearcher talked about how like a perfume he found tigers markings to smell to him... although the marker fluids are not urine they are probably similar as with our female ejaculations what are not urine but share some chemical components

...nila... you mean people could eventually take markings from wild cats or even all animals urine to mix them with their own cell samples in the petri dishes...

ascende... this could work... as well as eventually we four who have allready chameleon and plant cell enhanced skins.. we would perhaps only need to bath with some tiny amount of animal markings/urine to further enhance our biological gene wealth

...mundu... i was reading on the internet a fantasy novel where a man and a woman who wanted to live as eremits in the wild met at some wild river and bathed there in the pools with the frogs and algae, they made lots of sex in the pools and peed in it, drank from it bathed in there resulting in them becoming enhanced with animal and plant feutures...

we too might find it enhancing us when we bath in ponds and waterplaces where wild animals bath

and take some samples for to cultivate them in the petri dishes in our labs ...

microalgae, frog skin cells, other animals sweat.... mixing our own sperm or female ejaculation fluids into the petri dishes

...although these were most important insights they shared till the last minute in the appartement, they needed to leave now to catch their planes what would spread them all over the globe... in the taxi to the aeroport they tried out their satelite phones with laptops so they could see luoma talking with the 6 interested to visit about their most recent insights

one woman did propose to build one big pool in the middle of the appartement where sometimes water could be taken out to let it filter down the water recycling installation with the stone and sand filters

thisway all the informations of the bathing processes would circulate again and again

ascende was jumping into that discussion.... why have i not thought about it, you might even plant some plants in the water what would help the recycling...

perma....although luoma can decide on her own how and if she would allow such a semi-natural biotope pool in the appartement to be built... i find it a very suiting proposition

like this it went on ... they could not leave it alone while on the planes watching following each other in text and video chat thisway also not feeling the small but real pain from having to leave each other when they did find that wonderfull harmonies
